Brand New Book ***** Print on Demand *****.Excerpt from Experiments With Drosophila Ampelophila Concerning Evolution Practically all the experimental studies of inheritance have extended through but few, rarely more than 6, generations and have been concerned with pairs of non-intergrading characters. In the present work more than 70 generations have been reared. This was possible for two reasons: *Drosophila ampelophila* Loew has a very short life-history, and it can be kept breeding throughout the year. The character abnormal wing-venation, the inheritance of which was studied, may be made to exhibit extreme variability, passing from less venation than normal through normal to extra venation, so great that the additional veins almost equal the normal in extent. At the Boston (1907) meeting of the International Zoological Congress a preliminary report was presented upon this subject, 6 generations having been obtained. During the summer of 1908 a report upon the work (covering about 25 generations) done at the Station for Experimental Evolution was submitted to the Director, but I deferred publication because I wished to test more in detail certain points, especially sexual selection and the further fate of the abnormal strains. This additional work was done at the American Museum of Natural History. Incidentally I obtained confirmation of the previous work, but for the most part the present paper includes only the Cold Spring Harbor data and the conclusions drawn are as given in the 1908 report, except where otherwise indicated. Material And Methods. *Drosophila ampelophila* (the small red-eyed pomace-fly) is very common about cider-mills, ripe fruit, vinegar-barrels, and the like. The larvae normally live in the pulp of rotting fruits, especially during the acetic-acid stage of decay. They will, however, thrive on the side...
