The need for special teaching in the application of the simpler aspects of physical chemistry to biology was first realized by the author while attempting to teach physics and physiology to the same group of college students in 1906. A collection of abstracts of papers on the subject was commenced but interrupted by various affairs, especially the change to medical teaching. It became evident, however, that even medical students with a crowded curriculum would do well to devote any available time to this subject if they expect to do any research or read current medical literature. The purpose of the book is not to go far into physical chemistry but to develop a tool for physiological research. Lengthy discussions of debated questions are avoided by tentatively accepting the hypothesis which fits the most facts, until a better one appears. For further discussion of any subject the reader is referred to the literature list and index. For facts, however, lie is referred to nature. It is not to be hoped that theories should coincide exactly with data available at present. Even in the most exact branches of chemistry the atomic weight determinations, for instance, do not exactly coincide with the values calculated from the atomic numbers, and there seems to be some doubt as to whether lead is one element or several. How much more uncertainty there should be about physiology, where determinations are vitiated by the great variability...
